SUMMARY

I am a Unity Developer with 1 year of commercial experience and nearly 2 years in game development. At Echoes of the Sun (VR, commercial project), I contributed to gameplay systems, AI behavior, and menu logic, delivering complex features and ensuring stability in production. I excel at problem solving, implementing gameplay mechanics, optimizing systems, and writing maintainable code, with strong experience in OOP, SOLID principles, and modular architecture.

SKILLS

Tech Skills & Tools

Unity Development	C#, DOTS, Unity (UI, AI, Animation, Timeline, Shaders, Localization, NavMesh, UniTask, FMOD, Behavior Trees, Odin Inspector, Zenject, Reflex)
Programming Paradigms	OOP, SOLID, Design Patterns, ECS, Job System, Async programming
Development Practices	Debugging, Optimization, Rapid Prototyping, Code Refactoring
Tools	Git, Rider, Visual Studio

Professional Skills

Game Development	Gameplay architecture, NPC AI, Dialogue systems, UI/UX Design
Algorithms	FSM, HSM, Behavior Trees, Data Structures
Soft Skills	Team Leadership, Team Collaboration, Agile/Scrum, Code Reviews
Problem Solving	Debugging complex systems, edge-case handling, performance optimization
Languages	Ukrainian (native), Russian (native), English (intermediate), Polish(intermediate)

WORK EXPERIENCE

Echoes of the sun June 2024 - May 2025

- Developed ghost NPC AI with Behavior Trees, implementing idle, tracking, and respawn behaviors.
- Built a modular NPC animation system with Timeline/Animator integration for randomized and scripted animations.
- Created a clothing customization system with editor tooling and UI for equipping outfits.
- Implemented interactive NPC logic, including autonomous navigation, scripted actions, and player-triggered dialogues.
- Designed and developed modular UI architecture (pause, main menus) and full settings system with persistent saving.
- Debugged and optimized gameplay, UI, and AI systems, resolving edge-case issues.

PROJECTS

Agario DOTS Prototype May 2025 - Present

Links: [Code](#)

- Developing a prototype of an Agar.io-like game using Unity DOTS and ECS architecture.
- Practicing high-performance entity management, collision detection, and system-based gameplay.
- Experimenting with scalable game mechanics and rapid prototyping using DOTS patterns.

PlanetFall:Redemption

March 2025 - June 2025

Links: [Game Page](#) | [Trailer](#) | [Live Gameplay](#)

- Developed a modular entity system for units and buildings using component-based architecture (AttackComponent, HealthComponent, MoveComponent, etc.).
- Designed and implemented a gameplay tag system and preliminary ability framework, inspired by GAS (Unreal), for flexible unit skills and interactions.
- Implemented unit command system for real-time strategy controls and AI behaviors.
- Built a centralized SO-based database for easy configuration of units and buildings (HP, attack, movement, etc.).
- Created functional mini-map and in-game alert system for enemy attacks and resource warnings.
- Implemented faction system and relationships for multiple unit types (humans, mechs, techs).
- Practiced rapid prototyping and iterative design to quickly validate gameplay mechanics.

Agar.io on SFML

January 2025 - March 2025

Links: [Code](#)

- Designed a custom **GameLoop** and GameObject/component system with Unity-like modularity on SFML + C#.
- Built flexible game state management to handle gameplay states (menu, gameplay, pause).
- Implemented lightweight dependency injection for decoupled core systems.
- Applied architectural patterns (Builder, Factory, State Machine) for scalable, reusable systems.
- Developed 2D animation system with frame-based playback and custom animation sequencing.
- Focused on clarity, testability, and scalability to support future growth.

Post-Office

September 2023 - May 2024

Links: [Game Page](#) | [Trailer](#)

- Led a small team in developing a first-person horror game.
- Integrated Zenject for scalable dependency injection across core systems and UI.
- Implemented dynamic ambient and sound systems to enhance atmosphere.
- Designed and built a modular inventory with item pickup, usage, and custom item logic.
- Developed interactive light system simulating realistic lamp behavior (on/off, flickering, breakdowns).
- Created a flexible quest and random event system to support variety in the game.
- Built complete UI: main menu, HUD, pause, and settings menus.

EDUCATION

2024 - Present Bachelor's Degree in Software Engineering at **Andrzej Frycz Modrzewski University** in Krakow, Poland
